Allowable Subject Matter

1. Claims 1-17 are allowed.

Regarding Claim 1, the prior art neither teaches nor fairly suggests a method for forming an image by means of an image sensor with an active area containing a plurality of pixels, comprising the steps of: in two interrogation runs performed on a first subset of pixels, resetting the first subset of pixels, exposing the first subset of pixels and reading out the output values of the first subset of pixels, wherein the two interrogation runs, a longer exposure and a shorter exposure are performed, combining the output values into a first combined

output value by means of a merging function which is truly monotonic, continuous and continuously differentiable in all the output values, wherein the merging function has the following properties: preference is given to the output value obtained from the longer exposure when the output values or a combination of the output values lie beneath given lower limit, preference is given to the output value obtained from the shorter exposure when the output values or a combination of the output values lie above a given upper limit, the merging function increases truly monotonically in the output values when the output values lie between the lower limit and the upper limit, and repeating steps (a) and (b) for at least one second subset of pixels, as claimed in Claim 1.

Claim 11 is substantially similar to Claim 1.
